TCP/IP and the Internet

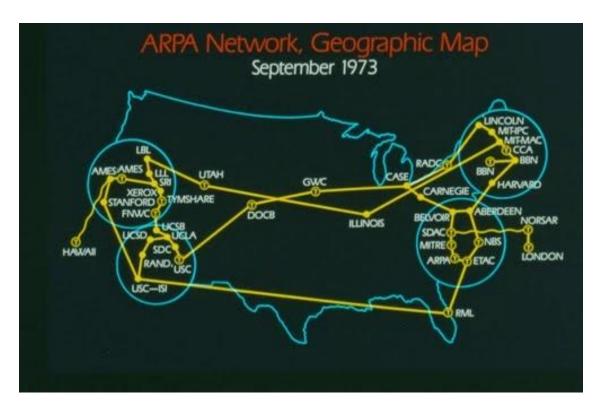

- In 1969
 - ARPA funded and created the "ARPANet" network
 - 美國高等研究計劃署 (ARPA: Advanced Research Project Agency)
 - NCP Network Control Protocol
 - Allow an exchange of information between separated computers
- In 1973
 - How to connect ARPANet with SATNet and ALOHANet
 - TCP/IP begun to be developed
- In 1983
 - TCP/IP protocols replaced NCP as the ARPANet's principal protocol
 - \circ ARPANet \rightarrow MILNet + ARPANet = Internet
- In 1985
 - The NSF created the NSFNet to connect to Internet

NSF: National Science Foundation

- In 1990
 - ARPANet passed out of existence, and in 1995, the NSFNet became the primary Internet backbone network

Introduction – ARPANet

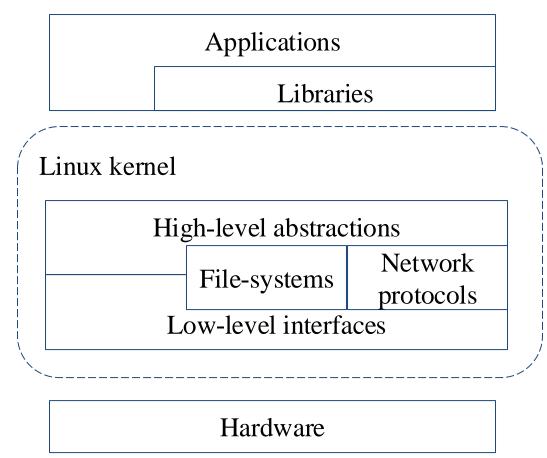

https://inventiontourblog.wordpress.com/2015/03/31/internet-advanced-research-project-agency-arpa-develops-the-first-computer-network/

Introduction – Why TCP/IP?

- The gap between applications and Network
 - Network
 - 802.3 Ethernet
 - 802.4 Token bus
 - 802.5 Token Ring
 - 802.11 Wireless
 - 802.16 WiMAX
 - Application
 - Reliable
 - Performance

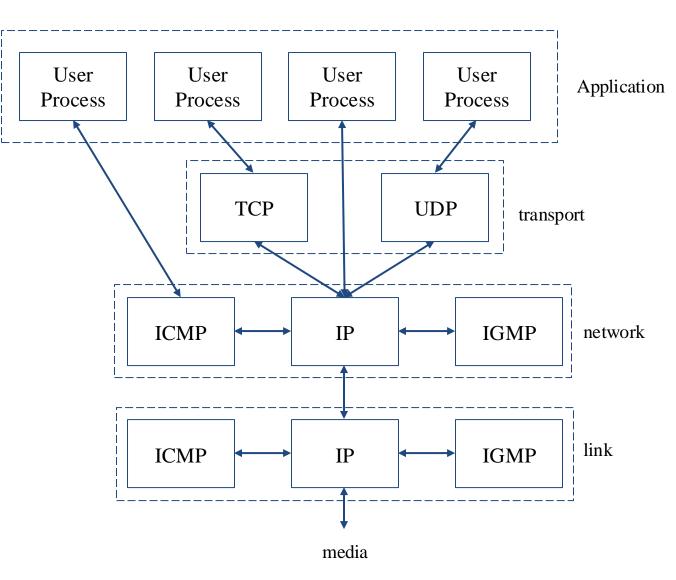

We need something to do the translating work! TCP/IP it is!!

Introduction – Layers of TCP/IP (1)

- TCP/IP is a suite of networking protocols
 - 4-layer architecture
 - Link layer (data-link layer)
 - Include device drivers to handle hardware details
 - Network layer (IP)
 - Handle the movement of packets around the network
 - Transport layer (Port)
 - Handle flow of data between hosts
 - Application

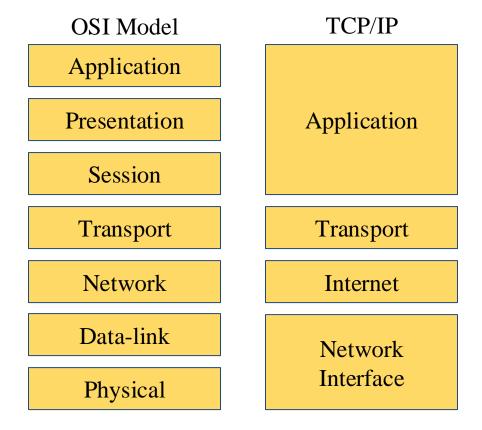

Introduction – Layers of TCP/IP (2)

- Each layer has several protocols
 - A layer define a data
 communication function that
 may be performed by certain
 protocols
 - A protocol provides a service suitable to the function of that layer

Introduction – Layers of TCP/IP (3)

- ISO/OSI Model (International Organization for Standardization / Open System Interconnection Reference Model)
- TCP/IP Model

TCP/IP and the OSI model

Introduction

- TCP/IP
 - Used to provide data communication between hosts
 - How to delivery data reliably
 - How to address remote host on the network
 - How to handle different type of hardware device

Introduction - Addressing

- Addressing
 - MAC Address
 - Media Access Control Address
 - 48-bit Network Interface Card Hardware Address
 - 24-bit manufacture ID
 - 24-bit serial number
 - **E**x:
 - 00:07:e9:10:e6:6b
 - IP Address
 - 32-bit Internet Address (IPv4)
 - Ex:
 - 140.113.209.64
 - o Port
 - 16-bit uniquely identify application (1 ~ 65535)
 - **■** Ex:
 - FTP port 21, SSH port 22, Telnet port 23

Link Layer

Link Layer – Introduction of Link Layer

- Purpose of the link layer
 - Send and receive IP datagram for IP module
 - ARP request and reply
 - RARP request and reply
- TCP/IP support various link layers, depending on the type of hardware used:
 - Ethernet
 - Teach in this class
 - Token Ring
 - FDDI (Fiber Distributed Data Interface)
 - Serial Line

Link Layer – Ethernet

- Features
 - Predominant form of local LAN technology used today
 - Use CSMA/CD
 - Carrier Sense, Multiple Access with Collision Detection
 - Use 48-bit MAC address
 - Operate at 10 Mbps
 - Fast Ethernet at 100 Mbps
 - Gigabit Ethernet at 1000 Mbps
 - 10 Gigabit Ethernet at 10,000 Mbps (10Gbps)
 - Ethernet frame format is defined in RFC 894
 - This is the actually used format in reality

Link Layer – Ethernet Frame Format

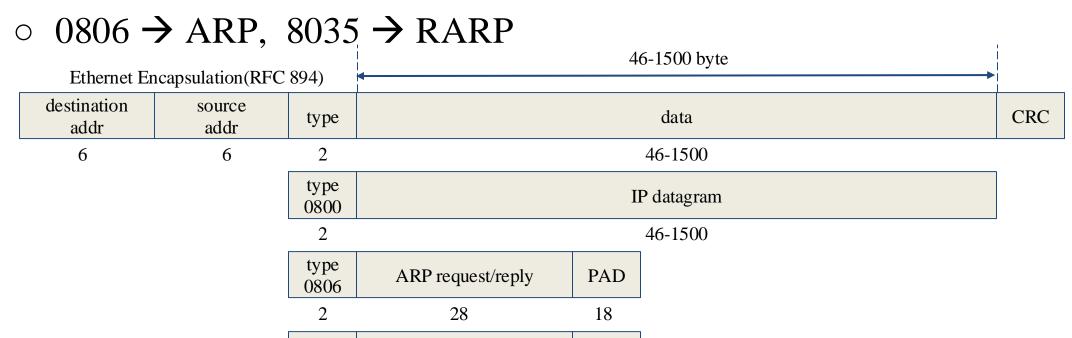

- 48-bit hardware address
 - For both destination and source address

type

0835

2

- 16-bit type is used to specify the type of following data
 - \circ 0800 \rightarrow IP datagram

PAD

18

RARP request/reply

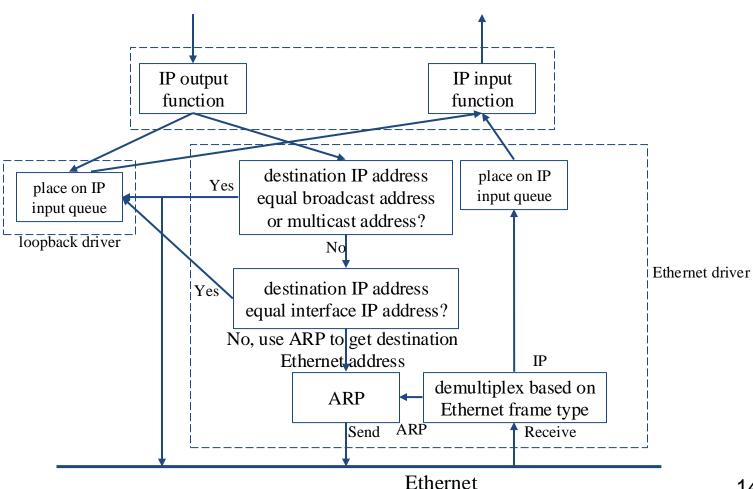

28

Link Layer – Loopback Interface

- Pseudo NIC
 - Allow client and server on the same host to communicate with each

other using TCP/IP

- o IP
 - **127.0.0.1**
- Hostname
 - localhost

Link Layer – MTU

- Maximum Transmission Unit
 - Limit size of payload part of Ethernet frame
 - 1500 bytes
 - o If the IP datagram is larger than MTU,
 - IP performs "fragmentation"
- MTU of various physical device
- Path MTU
 - Smallest MTU of any data link MTU between the two hosts
 - Depend on route

Network	MTU (bytes)		
Hyperchannel	65536		
16 Mbits/sec token ring (IMB)	17914		
4 Mbits/sec token ring (IEEE 802.5)	4464		
FDDI	4352		
Ethernet	1500		
IEEE 802.3/802.2	1492		
X.25	576		
Point-to-point (low delay)	296		

Link Layer – MTU

• To get MTU info

Network Layer

Network Layer – Introduction to Network Layer

- Unreliable and connectionless datagram delivery service
 - IP Routing
 - IP provides best effort service (unreliable)
 - IP datagram can be delivered out of order (connectionless)
- Protocols using IP
 - o TCP, UDP, ICMP, IGMP

Network Layer – IP Header

• 20 bytes in total length, except options

15 16 31 4-bit 4-bit header 8-bit type of service 16-bit total length (in bytes) (TOS) length version 3-bit 16-bit identification 13-bit fragment offset flags 8-bit time to live 8-bit protocol 16-bit header checksum 20 bytes (TTL) 32-bit source IP address 32-bit destination IP address options (if any) data

The Network Layer – IP Address

- 32-bit long
 - Network part
 - Identify a logical network
 - Host part
 - Identify a machine on certain network

- E.g.,
 - o NCTU
 - Class B address: 140.113.0.0
 - Network ID: 140.113
 - Number of hosts: 256*256 = 65536

• IP address category

Class	1st byte	Format	Comments	
A	1-126	N.H.H.H	Very early networks, or reserved for DOD	
В	128-191	N.N.H.H	Large sites, usually subnetted, were to get	
С	192-223	N.N.N.H	Easy to get, often obtained in sets	
D	224-239	_	Multicast addresses, not permanently assigned	
Е	240-254	_	Experimental addresses	

Network Layer – Subnetting, CIDR, and Netmask (1)

- Problems of Class A or B network
 - Number of hosts is enormous
 - Hard to maintain and management
 - Solution => Subnetting
- Problems of Class C network
 - 255*255*255 number of Class C network make the size of Internet routes huge
 - Solution => Classless Inter-Domain Routing

Network Layer – Subnetting, CIDR, and Netmask (2)

- Subnetting
 - Borrow some bits from host ID to extends network ID
 - ∘ E.g.,
 - Class B address: 140.113.0.0
 - = 256 Class C-like IP addresses in N.N.N.H subnetting method
 - 140.113.209.0 subnet
- Benefits of subnetting
 - Reduce the routing table size of Internet routers
 - o Ex:
 - All external routers have only one entry for 140.113 Class B network

Network Layer – Subnetting, CIDR, and Netmask (3)

- Netmask
 - Specify how many bits of IP address are used for network-ID
 - Continuous 1's in the leftmost bits form the network part
 - ∘ E.g.,
 - 255.255.255.0 in NCTU-CS example
 - 256 hosts available
 - **255.255.255.248** in ADSL example
 - Only 8 hosts available
 - Shorthand notation
 - Address/prefix-length
 - Ex: 140.113.209.8/24

Network Layer – Subnetting, CIDR, and Netmask (4)

- How to determine your network ID?
 - Bitwise-AND IP and netmask
 - ∘ E.g.,
 - o 140.113.214.37 & 255.255.255.0 => 140.113.214.0
 - o 140.113.209.37 & 255.255.255.0 => 140.113.209.0
 - 0 140.113.214.37 & 255.255.0.0 => 140.113.0.0
 - 140.113.209.37 & 255.255.0.0 => 140.113.0.0
 - o 211.23.188.78 & 255.255.255.248 => 211.23.188.72
 - \blacksquare 78 = 0100 1110
 - **8** 78 & 248 = 0100 1110 & 1111 1000 = 0100 1000 = 72

Network Layer – Subnetting, CIDR, and Netmask (5)

- In a subnet, not all IP are available
- The first one IP \rightarrow network ID
- The last one IP \rightarrow broadcast address
- E.g.,

```
Netmask 255.255.255.0
140.113.209.32/24

140.113.209.0 => network ID
140.113.209.255 => broadcast address
1 ~ 254, total 254 IPs are usable
```

```
Netmask 255.255.255.248
211.23.188.78/29

211.23.188.72 => network ID
211.23.188.79 => broadcast address
73 ~ 78, total 6 IPs are usable
```

Network Layer – Subnetting, CIDR, and Netmask (6)

- The smallest subnetting
 - Network portion : 30 bits
 - Host portion : 2 bits
 - => 4 hosts, but only 2 IPs are available
- ipcalc
 - \$ pkg install ipcalc
 - /usr/ports/net-mgmt/ipcalc

```
$ ipcalc 140.113.235.100/28
Address:
           140.113.235.100
                                 10001100.01110001.11101011.0110 0100
Netmask:
           255.255.255.240 = 28 11111111.11111111.11111111.1111 0000
Wildcard:
           0.0.0.15
                                 00000000.00000000.00000000.0000 1111
=>
Network:
           140.113.235.96/28
                                 10001100.01110001.11101011.0110 0000
HostMin:
           140.113.235.97
                                 10001100.01110001.11101011.0110 0001
HostMax:
           140.113.235.110
                                 10001100.01110001.11101011.0110 1110
Broadcast: 140.113.235.111
                                 10001100.01110001.11101011.0110 1111
Hosts/Net: 14
                                  Class B
```

Network Layer – Subnetting, CIDR, and Netmask (7)

• Network configuration for various lengths of netmask

Length	Host bits	Hosts/net	Dec. netmask	Hex netmask
/20	12	4094	255.255.240.0	0xFFFFF000
/21	11	2046	255.255.248.0	0xFFFFF800
/22	10	1022	255.255.252.0	0xFFFFFC00
/23	9	510	255.255.254.0	0xFFFFE00
/24	8	254	255.255.255.0	0xFFFFFF00
/25	7	126	255.255.255.128	0xFFFFFF80
/26	6	62	255.255.255.192	0xFFFFFC0
/27	5	30	255.255.255.224	0xFFFFFE0
/28	4	14	255.255.255.240	0xFFFFFF0
/29	3	6	255.255.255.248	0xFFFFFF8
/30	2	2	255.255.255.252	0xFFFFFFC

Network Layer – Subnetting, CIDR, and Netmask (8)

- CIDR (Classless Inter-Domain Routing)
 - Use address mask instead of old address classes to determine the destination network
 - CIDR requires modifications to routers and routing protocols
 - Need to transmit both destination address and mask
 - \circ Ex:
 - We can merge two Class C network:203.19.68.0/24, 203.19.69.0/24 => 203.19.68.0/23
 - Benefit of CIDR
 - We can allocate continuous Class C network to organization
 - Reflect physical network topology
 - Reduce the size of routing table

Network Layer – IP Routing (1)

- Difference between Host and Router
 - Router forwards datagram from one of its interface to another, while host does not
 - Almost every Unix system can be configured to act as a router or both
 - net.inet.ip.forwarding=1

Router

- IP layer has a routing table, which is used to store the information for forwarding datagram
- When router receives a datagram
 - If Dst. IP = my IP, demultiplex to target protocol
 - Otherwise, forward the IP based on routing table

Network Layer – IP Routing (2)

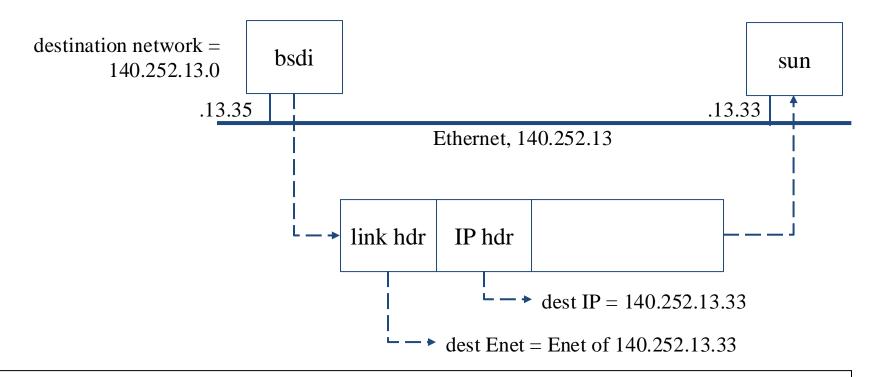

- Routing table information
 - Destination IP
 - IP address of next-hop router or IP address of a directly connected network
 - o Flags
 - Next interface
- IP routing
 - Done on a hop-by-hop basis
 - It assumes that the next-hop router is closer to the destination
 - Steps:
 - Search routing table for complete matched IP address
 - Send to next-hop router or to the directly connected NIC
 - Search routing table for matched network ID
 - Send to next-hop router or to the directly connected NIC
 - Search routing table for default route
 - Send to this default next-hop router
 - host or network unreachable

Network Layer – IP Routing (3)

• Ex1: routing in the same network

o bsdi: 140.252.13.35

o sun: 140.252.13.33

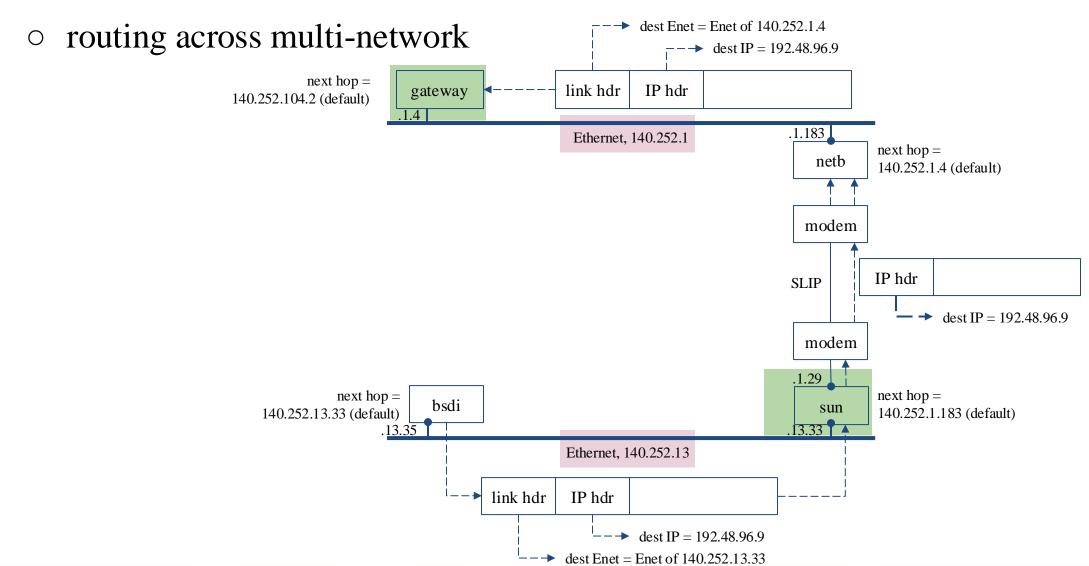

Ex Routing table:

140.252.13.33 00:d0:59:83:d9:16

UHLW fxp1

Network Layer – IP Routing (4)

• Ex2:

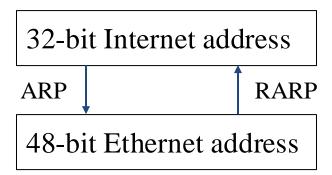

ARP and RARP

Something between MAC (link layer) And IP (network layer)

國立陽明交通大學資工系資訊中心

ARP and RARP

- ARP Address Resolution Protocol and
 - RARP Reverse ARP
 - Mapping between IP and Ethernet address
- When an Ethernet frame is sent on LAN from one host to another,
 - It is the 48-bit Ethernet address that determines for which interface the frame is destined

ARP and RARP – ARP Example

ARP request (Ethernet broadcast)

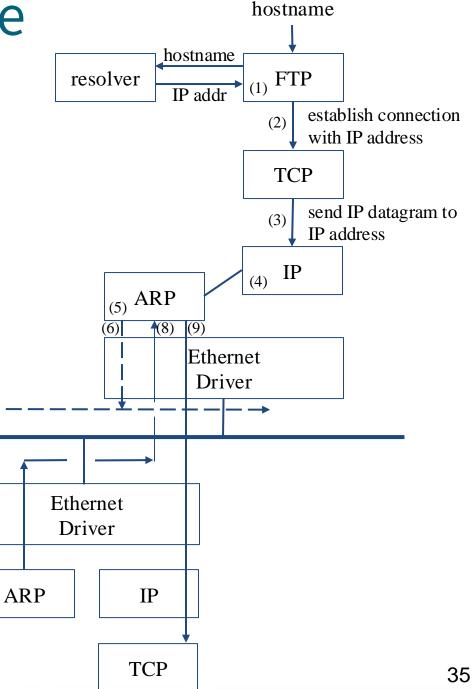

(7)

Ethernet Driver

ARP

Example

- % ftp bsd1
- (4) next-hop or direct host
- (5) Search ARP cache
- (6) Broadcast ARP request
- o (7) bsd1 response ARP reply
- (9) Send original IP datagram

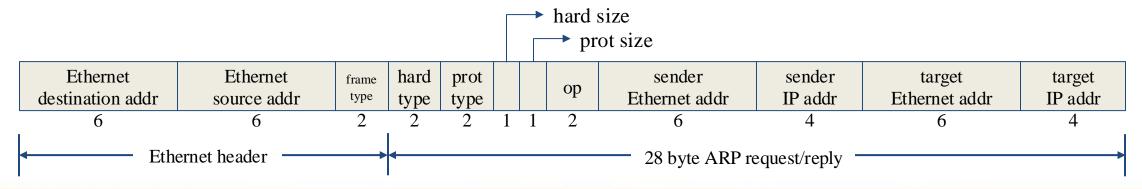

ARP and RARP – ARP Cache

- Maintain recent ARP results
 - Come from both ARP request and reply
 - Expiration time
 - \blacksquare Complete entry = 20 minutes
 - Incomplete entry = 3 minutes
 - Use arp command to see the cache
 - E.g.:
 - \$ arp -a # show ARP cache
 - \$ arp -da # delete all entries in ARP cache
 - \$ arp -S 140.113.235.132 00:0e:a6:94:24:6e # create ARP entry

```
$ arp -a crypto23.csie.nctu.edu.tw (140.113.208.143) at 00:16:e6:5b:fa:e9 on fxp1 [ethernet] e3rtn-208.csie.nctu.edu.tw (140.113.208.254) at 00:0e:38:a4:c2:00 on fxp1 [ethernet] e3rtn-210.csie.nctu.edu.tw (140.113.210.254) at 00:0e:38:a4:c2:00 on fxp2 [ethernet]
```

ARP and RARP – ARP/RARP Packet Format

- Ethernet destination addr: all 1's (broadcast)
- Known value for IP <-> Ethernet
 - Frame type: 0x0806 for ARP, 0x8035 for RARP
 - Hardware type: type of hardware address (1 for Ethernet)
 - Protocol type: type of upper layer address (0x0800 for IP)
 - Hard size: size in bytes of hardware address (6 for Ethernet)
 - Protocol size: size in bytes of upper layer address (4 for IP)
 - o Op: 1, 2, 3, 4 for ARP request, reply, RARP request, reply

ARP and RARP – Use tcpdump to see ARP

- Host 140.113.17.212 => 140.113.17.215
 - Clear ARP cache of 140.113.17.212
 - \$ sudo arp -d 140.113.17.215
 - Run tcpdump on 140.113.17.215
 - 1 \$ sudo tcpdump -i sk0 -e arp
 - 2 \$ sudo tcpdump -i sk0 -n -e arp
 - \$\blue{\text{sudo tcpdump -i sk0 -n -t -e arp}}
 - o On 140.113.17.212, ssh to 140.113.17.215

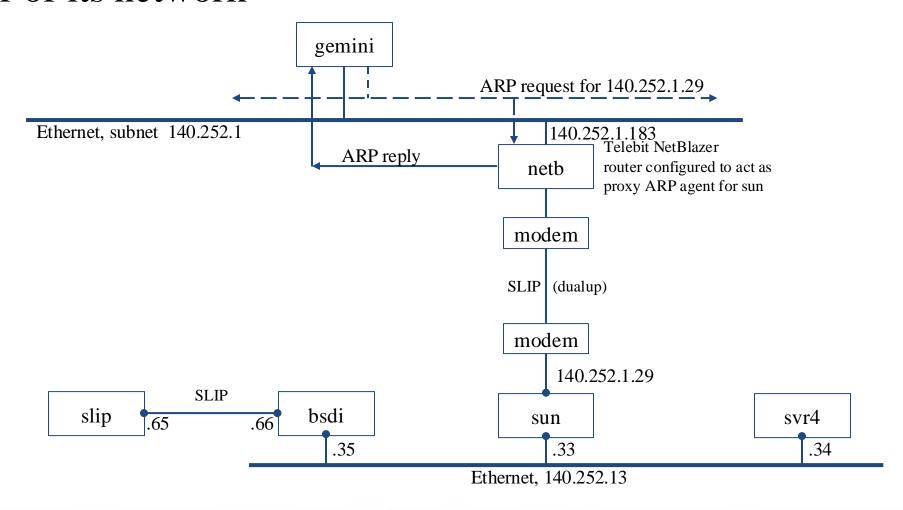

- (00:11:d8:06:1e:81)
 - Print the link-level header on each dump line.
 - -n Don't convert addresses to names.
 - -t Don't print a timestamp on each dump line.

```
15:18:54.899779 00:90:96:23:8f:7d > Broadcast, ethertype ARP (0x0806), length 60:
    arp who-has nabsd tell chbsd.csie.nctu.edu.tw
15:18:54.899792 00:11:d8:06:1e:81 > 00:90:96:23:8f:7d, ethertype ARP (0x0806), length 42:
    arp reply nabsd is-at 00:11:d8:06:1e:81
```

- 2 15:26:13.847417 00:90:96:23:8f:7d > ff:ff:ff:ff:ff:ff:ff; ethertype ARP (0x0806), length 60: arp who-has 140.113.17.215 tell 140.113.17.212 15:26:13.847434 00:11:d8:06:1e:81 > 00:90:96:23:8f:7d, ethertype ARP (0x0806), length 42: arp reply 140.113.17.215 is-at 00:11:d8:06:1e:81
- 00:90:96:23:8f:7d > ff:ff:ff:ff:ff:ff; ethertype ARP (0x0806), length 60:
 arp who-has 140.113.17.215 tell 140.113.17.212
 00:11:d8:06:1e:81 > 00:90:96:23:8f:7d, ethertype ARP (0x0806), length 42:
 arp reply 140.113.17.215 is-at 00:11:d8:06:1e:81

ARP and RARP – Proxy ARP

• Let router answer ARP request on one of its networks for a host on another of its network

ARP and RARP – Gratuitous ARP

- Gratuitous ARP
 - The host sends an ARP request looking for its own IP
 - Provide two features
 - Used to determine whether there is another host configured with the same IP
 - Used to cause any other host to update ARP cache when changing hardware address

ARP and RARP – RARP

- Principle
 - Used for the diskless system to read its hardware address from the
 NIC and send an RARP request to gain its IP
- RARP Server Design
 - RARP server must maintain the map from hardware address to an IP address for many hosts
 - Link-layer broadcast
 - This prevent most routers from forwarding an RARP request

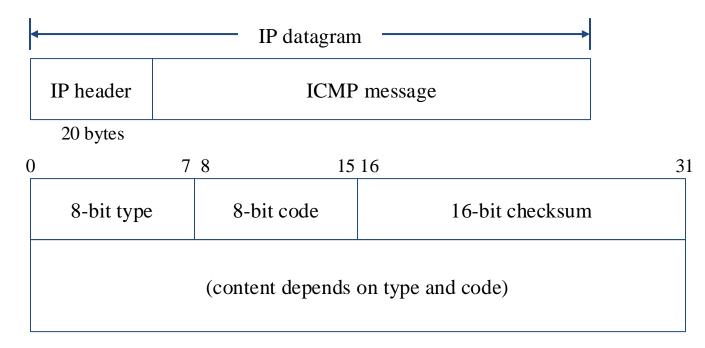

ICMP

Internet Control Message Protocol

國立陽明交通大學資工系資訊中心

ICMP - Introduction

- Part of the IP layer
 - o ICMP messages are transmitted within IP datagram
 - ICMP communicates error messages and other conditions that require attention for other protocols
- ICMP message format

ICMP – Message Type (1)

type	code	Description	Query	Error
0	0	echo reply (Ping reply)	•	
3		destination unreachable:		
	0	> network unreachable		•
	1	> host unreachable		•
	2 > protocol unreachable 3 > port unreachable 4 > fragmentation needed but don't fragment bit set 5 > source route failed 6 > destination network unknown 7 > destination host unknown 8 > source host isolated (obsolete) 9 > destination network administratively prohibited			•
				•
				•
				•
				•
				•
				•
				•
10 > destination host admir		> destination host administratively prohibited		•

type	code	Description	Query	Error
	11	> network unreachable for TOS		•
> host unreachable for TOS			•	
	> communication administratively prohibited by filtering			•
14 > host precedence violation		> host precedence violation		•
	15	> precedence cutoff effect		•

ICMP – Message Type (2)

type	code	Description	Query	Error
4	0	source quench (elementary flow control)		•
5		redirect:		
	0	> redirect for network		•
	1	> redirect for host		•
	2	> redirect for type-of-service and network		•
	3	> redirect for type-of-service and host		•
8	0	echo request (Ping request)	•	
9	0	router advertisement	•	
10			•	
11				
	0	> time-to-live equals 0 during transit (Traceroute)		•
	1	> time-to-live equals 0 during reassembly		•

type	code	Description	Query	Error
12		parameter problem:		
	0	> IP header bad (catchall error)		•
	1	> required option missing		•
13	0	timestamp request •		
14	0	timestamp reply •		
15	0	information request (obsolete)		
16	0	information reply (obsolete) •		
17	0	address mask request	•	
18	0	address mask reply		

- Address Mask Request/Reply (1)
- Address Mask Request and Reply
 - Used for diskless system to obtain its subnet mask
 - Identifier and sequence number
 - Can be set to anything for sender to match reply with request
 - The receiver will response an ICMP reply with the subnet mask of the receiving NIC

0	7	8 15	16 31		
	type (17 or 18)	code (0)	checksum		
	iden	tifier	sequence number		
	address mask				

Address Mask Request/Reply (2)

• Example:

```
$ ping -M m sun1.cs.nctu.edu.tw
ICMP_MASKREQ
PING sun1.cs.nctu.edu.tw (140.113.235.171): 56 data bytes
68 bytes from 140.113.235.171: icmp_seq=0 ttl=251 time=0.663 ms mask=255.255.255.0
68 bytes from 140.113.235.171: icmp_seq=1 ttl=251 time=1.018 ms mask=255.255.255.0
68 bytes from 140.113.235.171: icmp_seq=2 ttl=251 time=1.028 ms mask=255.255.255.0
68 bytes from 140.113.235.171: icmp_seq=3 ttl=251 time=1.026 ms mask=255.255.255.0
^C
--- sun1.cs.nctu.edu.tw ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.663/0.934/1.028/0.156 ms

$ icmpquery -m sun1
sun1 : 0xFFFFFF00
```

icmpquery can be found in /usr/ports/net-mgmt/icmpquery

-M mask | time Use ICMP_MASKREQ or ICMP_TSTAMP instead of ICMP_ECHO.

- Timestamp Request/Reply (1)

- Timestamp request and reply
 - Allow a system to query another for the current time
 - Milliseconds resolution, since midnight UTC
 - Requestor
 - Fill in the originate timestamp and send
 - Reply system
 - Fill in the receive timestamp when it receives the request and the transmit time when it sends the reply

0	7	8 15	16 31	
type (13	or 14)	code (0)	checksum	
	identifier		sequence number	
originate timestamp				
	receive timestamp			
transmit timestamp				

– Timestamp Request/Reply (2)

• Example

-M mask | time Use ICMP_MASKREQ or ICMP_TSTAMP instead of ICMP_ECHO.

```
$ sudo tcpdump -i sk0 -e icmp
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on sk0, link-type EN10MB (Ethernet), capture size 96 bytes
14:48:24.999106 00:90:96:23:8f:7d > 00:11:d8:06:1e:81, ethertype IPv4 (0x0800), length 110:
    chbsd.csie.nctu.edu.tw > nabsd: ICMP time stamp query id 18514 seq 0, length 76

```

ICMP – Error Message

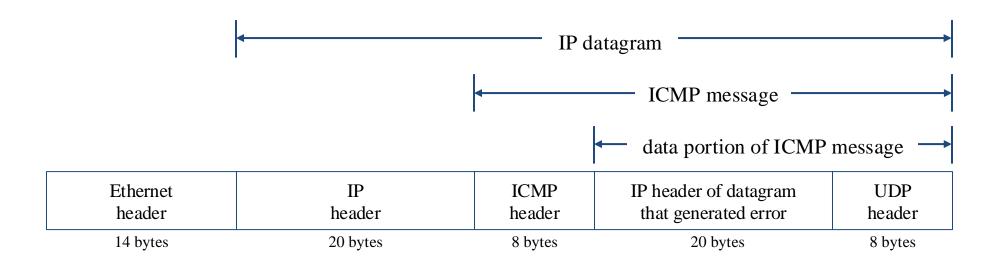

- Destination Unreachable Error Message

- Format
 - 8 bytes ICMP Header
 - Application-depend data portion
 - IP header
 - Let ICMP know how to interpret the 8 bytes that follow
 - first 8 bytes that followed this IP header
 - Information about who generates the error

ICMP – Error Message

- Port Unreachable (1)
- ICMP port unreachable
 - \circ Type = 3, code = 3
 - Host receives a UDP datagram but the destination port does not correspond to a port that some process has in use

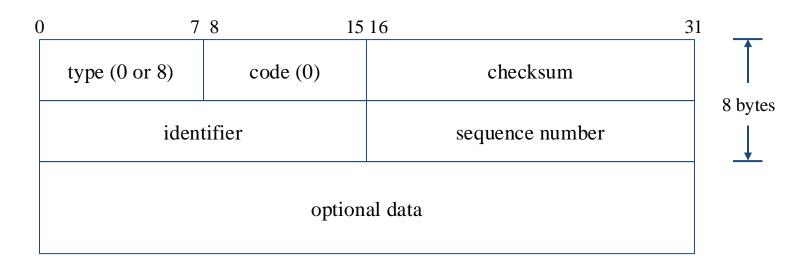

ICMP – Error Message

- Port Unreachable (2)
- Example:
 - Using TFTP (Trivial File Transfer Protocol)
 - Original port: 69

```
$ tftp
tftp> connect localhost 8888
tftp> get temp.foo
Transfer timed out.
tftp>
```

ICMP – Ping Program (1)

- Use ICMP to test whether another host is reachable
 - Type 8, ICMP echo request
 - Type 0, ICMP echo reply
- ICMP echo request/reply format
 - Identifier: process ID of the sending process
 - Sequence number: start with 0
 - Optional data: any optional data sent must be echoed

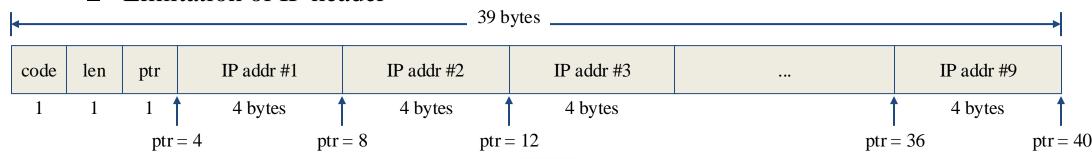

ICMP – Ping Program (2)

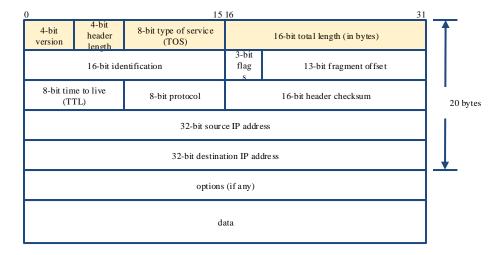

- Ex:
 - ServerA ping ServerB
 - o execute "tcpdump -i sk0 -X -e icmp" on ServerB

```
ServerA $ ping ServerB
       PING ServerB.cs.nctu.edu.tw (140.113.17.215): 56 data bytes
       64 bytes from 140.113.17.215: icmp seq=0 ttl=64 time=0.520 ms
       15:08:12.631925 00:90:96:23:8f:7d > 00:11:d8:06:1e:81, ethertype IPv4 (0x0800), length 98:
           ServerA.cs.nctu.edu.tw > ServerB: ICMP echo request, id 56914, seq 0, length 64

```

ICMP – Ping Program (3)

- To get the route that packets take to host
 - Taking use of "IP Record Route Option"
 - Command: ping -R (deprecated)
 - Cause every router that handles the datagram to add its (outgoing) IP address to a list in the options field.
 - Format of Option field for IP RR Option
 - code: type of IP Option (7 for RR)
 - len: total number of bytes of the RR option
 - ptr:4 ~ 40 used to point to the next IP address
 - Only 9 IP addresses can be stored
 - Limitation of IP header

IP datagram -

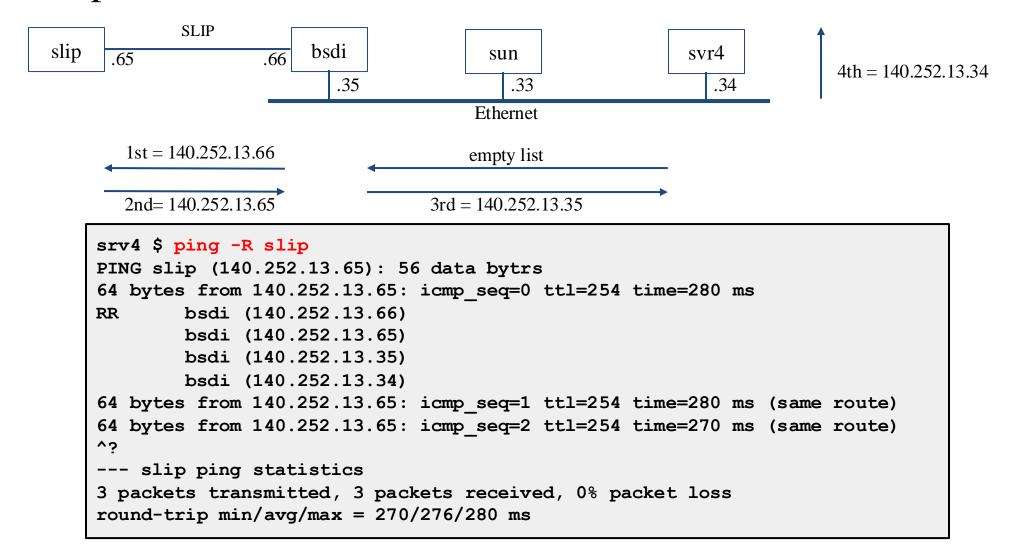

IP header

20 bytes

ICMP message

ICMP – Ping Program (4)

• Example:

ICMP – Ping Program (5)

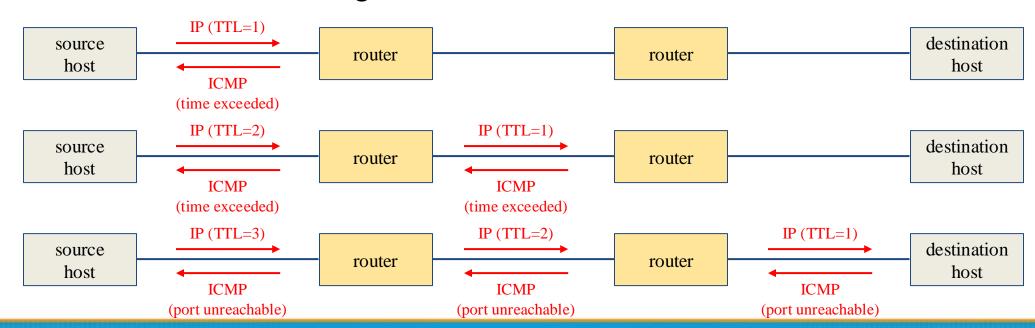

• Example:

Traceroute Program (1)

- To print the route to the destination
- Drawbacks of IP RR options (ping -R)
 - Not all routers have supported the IP RR option
 - Limitation of IP header length
- Background knowledge of traceroute
 - When a router receive a datagram, it will decrement the TTL by one
 - \circ When a router receive a datagram with TTL = 0 or 1,
 - it will throw away the datagram and
 - sends back a "Time exceeded" ICMP message
 - Unused UDP port will generate a "port unreachable" ICMP message

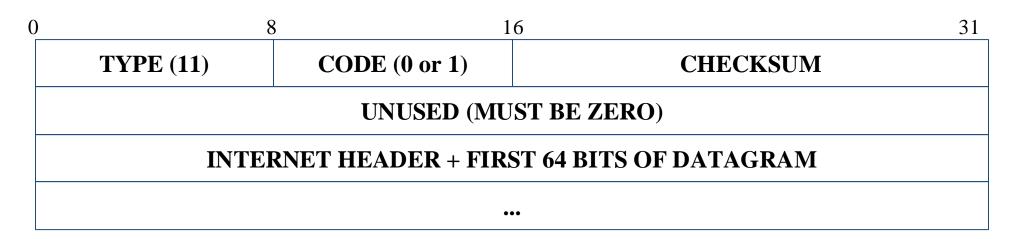

Traceroute Program (2)

- Operation of traceroute
 - Send UDP with port > 30000, encapsulated with IP header with TTL = 1, 2, 3, ...
 continuously
 - When router receives the datagram and TTL = 1, it returns a "Time exceeded" ICMP message
 - When destination host receives the datagram (TTL = 1), it returns a "Port unreachable" ICMP message

Traceroute Program (3)

- Time exceed ICMP message
 - \circ Type = 11, code = 0 or 1
 - Code = 0 means TTL=0 during transit
 - Code = 1 means TTL=0 during reassembly
 - First 8 bytes of datagram
 - UDP header

Traceroute Program (4)

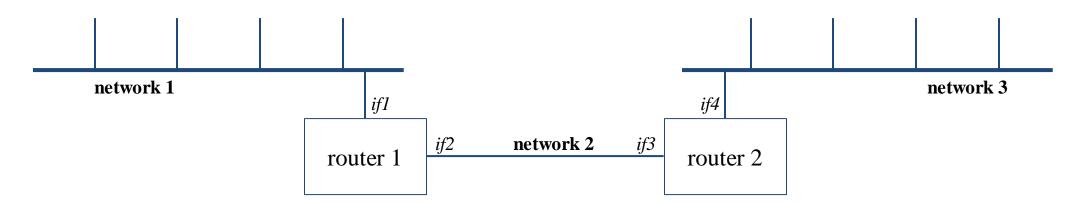

Example

```
$ traceroute bsd1.cs.nctu.edu.tw traceroute to bsd1.cs.nctu.edu.tw (140.113.235.131), 64 hops max, 40 byte packets 1 e3rtn.csie.nctu.edu.tw (140.113.17.254) 0.377 ms 0.365 ms 0.293 ms 2 ProjE27-254.NCTU.edu.tw (140.113.27.254) 0.390 ms 0.284 ms 0.391 ms 3 140.113.0.58 (140.113.0.58) 0.292 ms 0.282 ms 0.293 ms 4 140.113.0.165 (140.113.0.165) 0.492 ms 0.385 ms 0.294 ms 5 bsd1.cs.nctu.edu.tw (140.113.235.131) 0.393 ms 0.281 ms 0.393 ms
```

```
$ sudo tcpdump -i sk0 -t icmp
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on sk0, link-type EN10MB (Ethernet), capture size 96 bytes
IP e3rtn.csie.nctu.edu.tw > nabsd: ICMP time exceeded in-transit, length 36
IP e3rtn.csie.nctu.edu.tw > nabsd: ICMP time exceeded in-transit, length 36
IP e3rtn.csie.nctu.edu.tw > nabsd: ICMP time exceeded in-transit, length 36
IP ProjE27-254.NCTU.edu.tw > nabsd: ICMP time exceeded in-transit, length 36
IP ProjE27-254.NCTU.edu.tw > nabsd: ICMP time exceeded in-transit, length 36
IP ProjE27-254.NCTU.edu.tw > nabsd: ICMP time exceeded in-transit, length 36
IP 140.113.0.58 > nabsd: ICMP time exceeded in-transit, length 36
IP 140.113.0.58 > nabsd: ICMP time exceeded in-transit, length 36
IP 140.113.0.58 > nabsd: ICMP time exceeded in-transit, length 36
IP 140.113.0.165 > nabsd: ICMP time exceeded in-transit, length 36
IP 140.113.0.165 > nabsd: ICMP time exceeded in-transit, length 36
IP 140.113.0.165 > nabsd: ICMP time exceeded in-transit, length 36
IP bsd1.cs.nctu.edu.tw > nabsd: ICMP bsd1.cs.nctu.edu.tw udp port 33447 unreachable, length 36
IP bsd1.cs.nctu.edu.tw > nabsd: ICMP bsd1.cs.nctu.edu.tw udp port 33448 unreachable, length 36
IP bsd1.cs.nctu.edu.tw > nabsd: ICMP bsd1.cs.nctu.edu.tw udp port 33449 unreachable, length 36
```

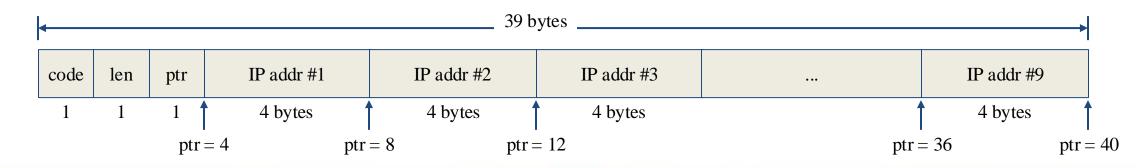

Traceroute Program (5)

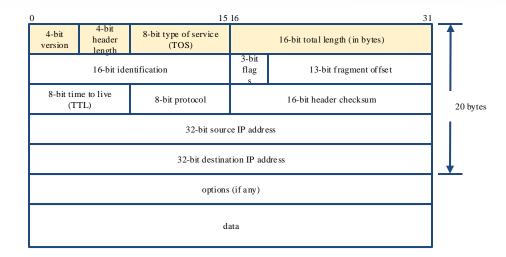

- The router IP in traceroute is the interface that receives the datagram. (incoming IP)
 - Traceroute from left host to right host
 - if1, if3
 - Traceroute from right host to left host
 - if4, if2

Traceroute Program – IP Source Routing Option (1)

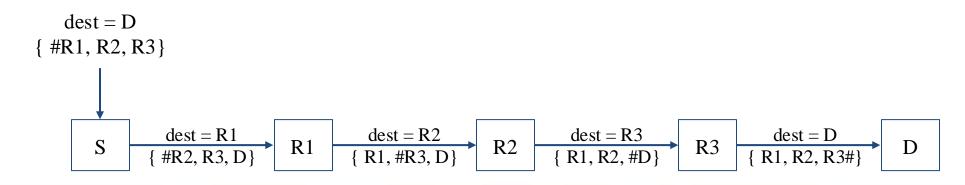

- Source Routing
 - Sender specifies the route
- Two forms of source routing
 - Strict source routing
 - Sender specifies the exact path that the IP datagram must follow
 - Loose source routing
 - As strict source routing, but the datagram can pass through other routers between any two addresses in the list
- Format of IP header option field
 - \circ Code = 0x89 for strict and code = 0x83 for loose SR option

Traceroute Program – IP Source Routing Option (2)

- Scenario of source routing
 - Sending host
 - Remove first entry and append destination address in the final entry of the list
 - Receiving router != destination
 - Loose source route, forward it as normal
 - Receiving router = destination
 - Next address in the list becomes the destination
 - Change source address
 - Increment the pointer

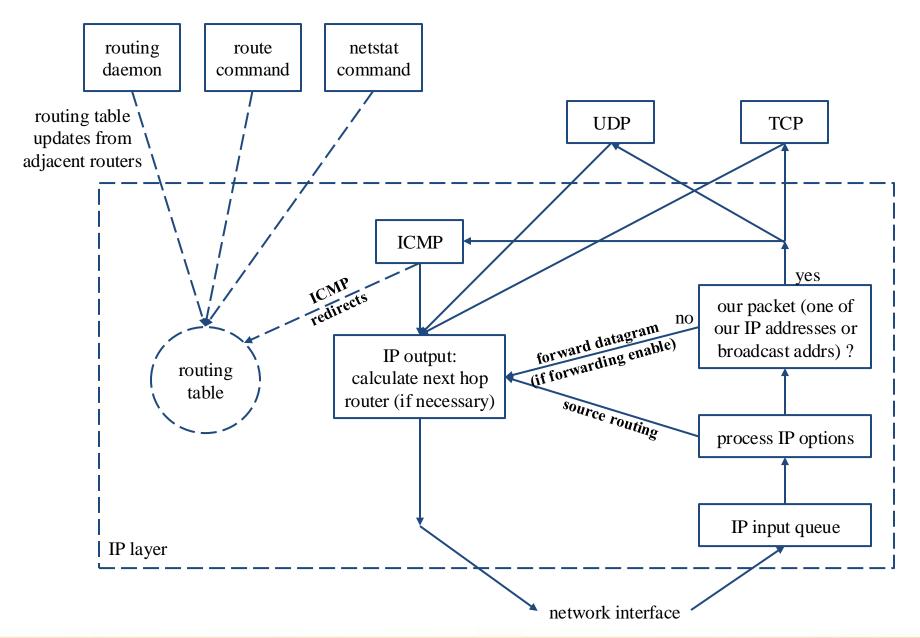

Traceroute Program – IP Source Routing Option (3)

- Traceroute using IP loose SR option
- Example:

```
$ traceroute u2.nctu.edu.tw
traceroute to u2.nctu.edu.tw (211.76.240.193), 64 hops max, 40 byte packets
   e3rtn-235 (140.113.235.254) 0.549 ms 0.434 ms
                                                   0.337 \, \mathrm{ms}
  140.113.0.166 (140.113.0.166) 108.726 ms 4.469 ms 0.362 ms
3 v255-194.NTCU.net (211.76.255.194) 0.529 ms 3.446 ms 5.464 ms
4 v255-229.NTCU.net (211.76.255.229) 1.406 ms 2.017 ms 0.560 ms
  h240-193.NTCU.net (211.76.240.193) 0.520 ms 0.456 ms 0.315 ms
$ traceroute -g 140.113.0.149 u2.nctu.edu.tw
traceroute to u2.nctu.edu.tw (211.76.240.193), 64 hops max, 48 byte packets
   e3rtn-235 (140.113.235.254) 0.543 ms 0.392 ms 0.365 ms

IP Routing – Processing in IP Layer

IP Routing – Routing Table (1)

- Routing Table
 - Command to list: netstat -rn
 - o Flag
 - U: the route is up
 - G: the route is to a router (indirect route)
 - Indirect route: IP is the dest. IP, MAC is the router's MAC
 - H: the route is to a host (Not to a network)
 - The dest. filed is either an IP address or network address
 - S: the route is static
 - Expire: expiration time for each route

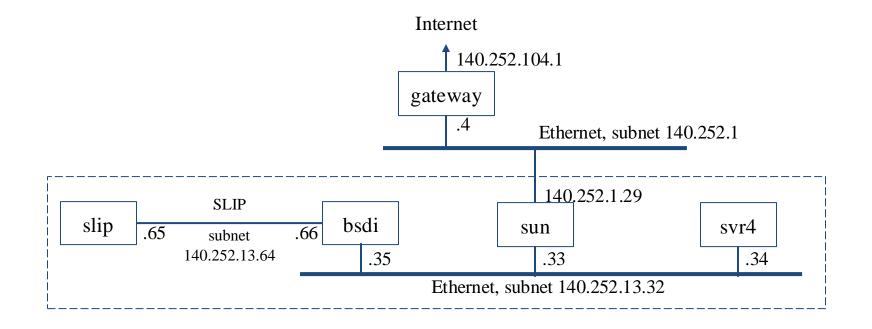

```
$ netstat -rn
Routing tables
Internet:
Destination Gateway
                         Flags
                                Netif
                                       Expire
         140.113.17.254UGS
Default
                                em0

                                                25043
```

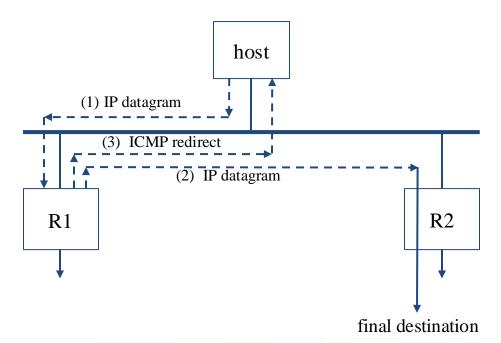

ICMP - No Route to Destination

- If there is no match in routing table
 - If the IP datagram is generated on the host
 - "host unreachable" or "network unreachable"
 - If the IP datagram is being forwarded
 - ICMP "host unreachable" error message is generated and sends back to sending host
 - ICMP message
 - Type = 3, code = 0 for host unreachable
 - Type = 3, code = 1 for network unreachable

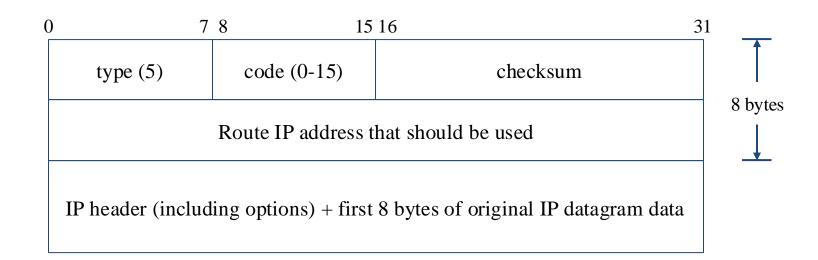

ICMP – Redirect Error Message (1)

- Concept
 - Used by router to inform the sender that the datagram should be sent to a different router
 - This will happen if the host has a choice of routers to send the packet to
 - Ex:
 - R1 found sending and receiving interface are the same

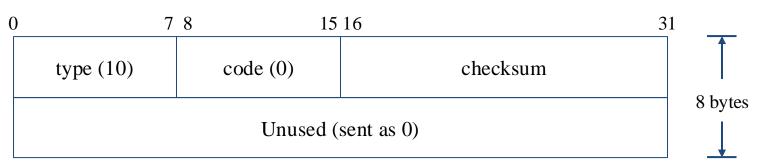

ICMP – Redirect Error Message (2)

- ICMP redirect message format
 - Code 0: redirect for network
 - Code 1: redirect for host
 - Code 2: redirect for TOS and network (RFC 1349)
 - Code 3: redirect for TOS and hosts (RFC 1349)

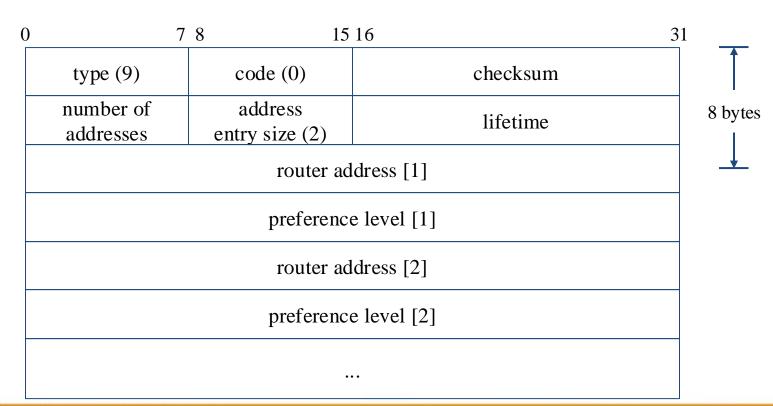

ICMP – Router Discovery Messages (1)

- Dynamic update host's routing table
 - ICMP router solicitation message (懇求)
 - Host broadcast or multicast after bootstrapping
 - ICMP router advertisement message
 - Router response
 - Router periodically broadcast or multicast
- Format of ICMP router solicitation message

ICMP – Router Discovery Messages (2)

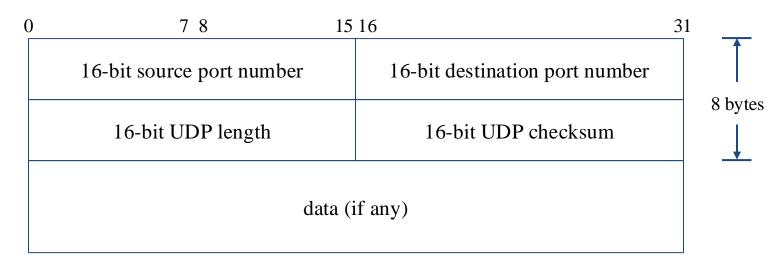

- Format of ICMP router advertisement message
 - Router address
 - Must be one of the router's IP address
 - Preference level
 - Preference as a default router address

UDP – User Datagram Protocol

UDP

- No reliability
 - o Datagram-oriented, not stream-oriented protocol
- UDP header
 - o 8 bytes
 - Source port and destination port
 - Identify sending and receiving process
 - UDP length: ≥ 8

UDP

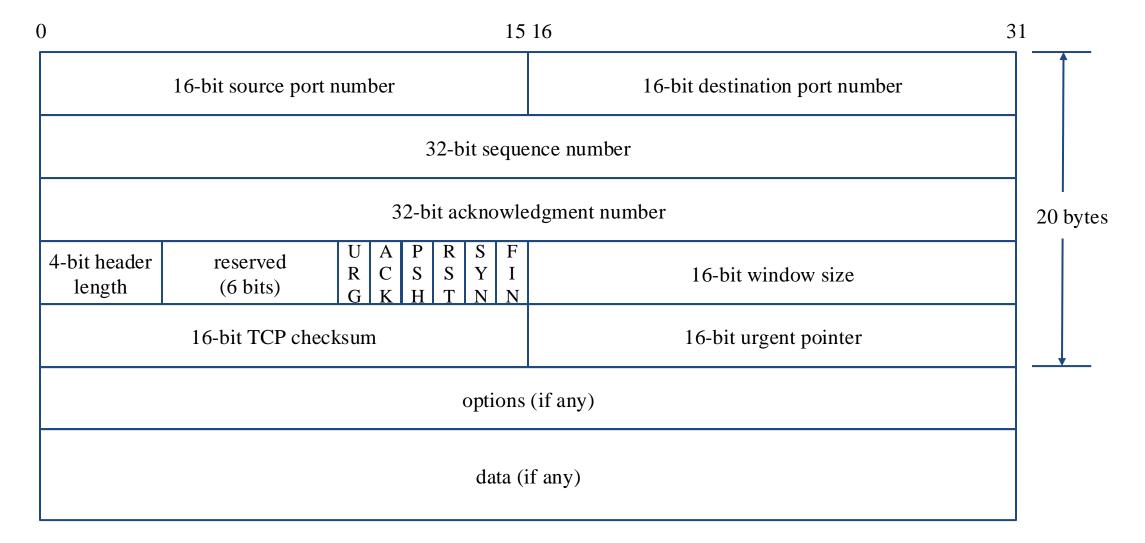

- Application
 - o VoIP
 - VPN (OpenVPN over UDP)
 - o DNS
 - o SNMP
 - Quick UDP Internet Connections (QUIC)
 - Designed by Google, based on UDP
 - Renamed to "HTTP/3"
 - Keep reliability as TCP, but less latency
 - As most HTTP connections will demand TLS, QUIC makes the exchange of setup keys and supported protocols part of the initial handshake process.
 - During network-switch events, reuse old connection instead of creating a new one as TCP does.

TCP - Transmission Control Protocol

TCP

- Services
 - Connection-oriented
 - Establish TCP connection before exchanging data
 - Reliability
 - Acknowledgement when receiving data
 - Retransmission when timeout
 - Ordering
 - Discard duplicated data
 - Flow control

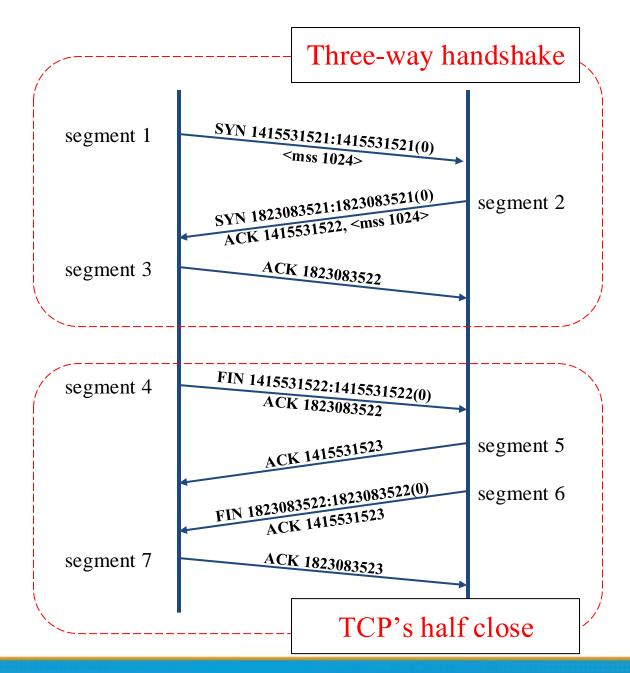

TCP – Header (1)

TCP – Header (2)

- Flags
 - o SYN
 - Establish new connection
 - \circ ACK
 - Acknowledgement number is valid
 - Used to ack previous data that host has received
 - o RST
 - Reset connection
 - o FIN
 - The sender is finished sending data

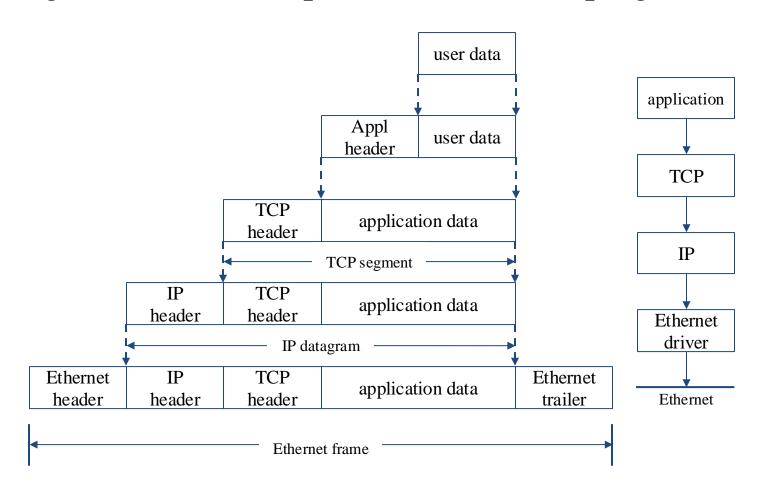

TCP connection – establishment and termination

Appendix

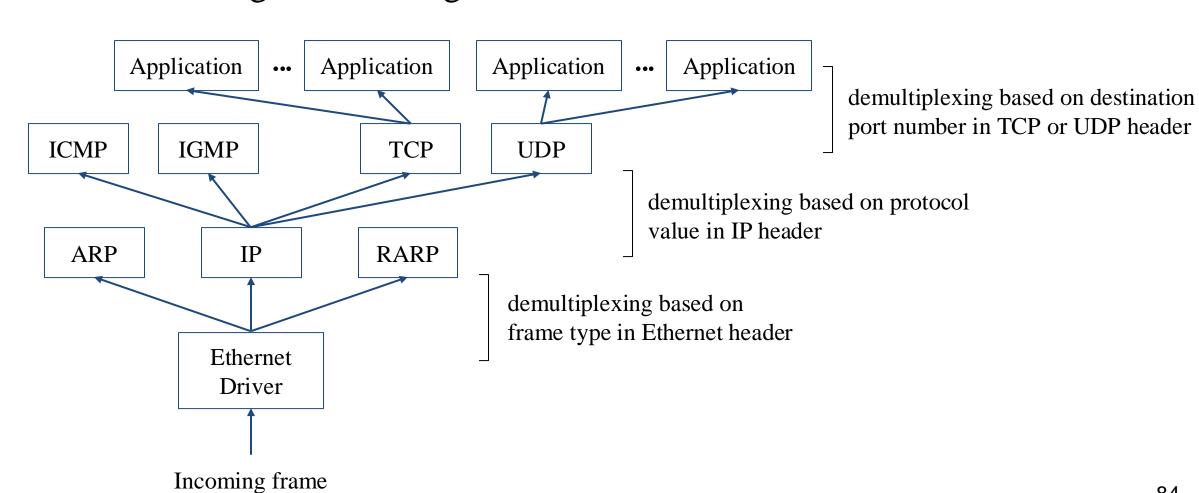

Introduction – Encapsulation

- Multiplexing
 - Gathering data from multiple sockets, enveloping data with header

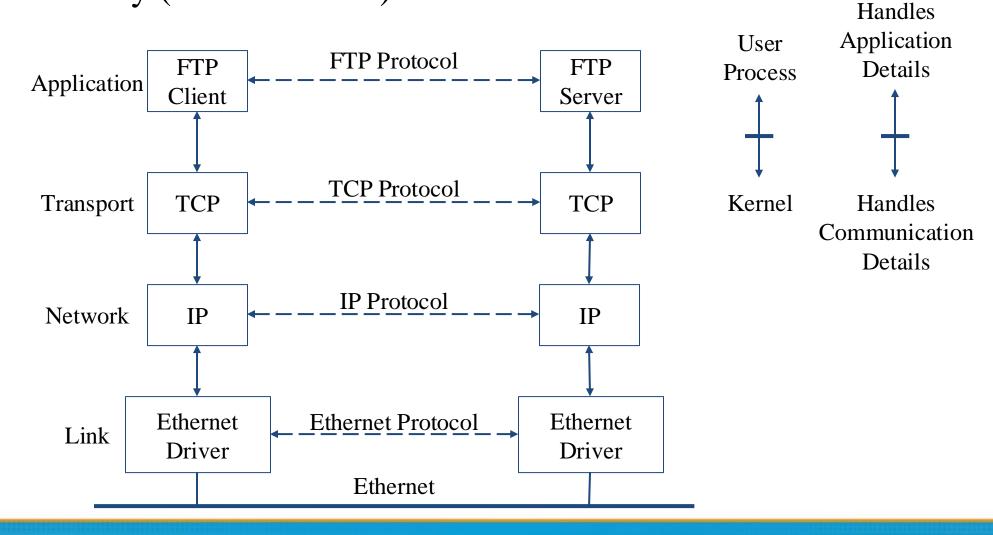

Introduction – Decapsulation

- Demultiplexing
 - Delivering received segments to correct socket

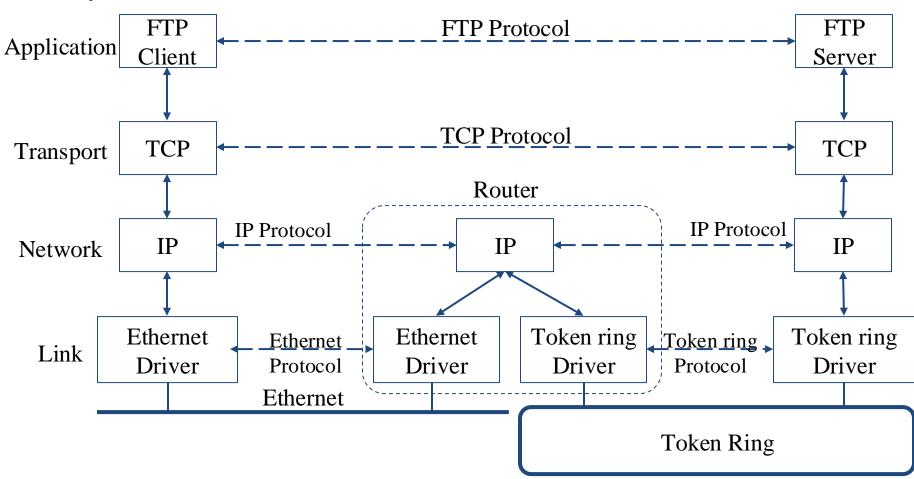

Introduction – Addressing

- Addressing
 - Nearby (same network)

Introduction – Addressing

- Addressing
 - Faraway (across network)

Network Layer – IP Header (1)

- Version (4-bit)
 - o 4 for IPv4 and 6 for IPv6
- Header length (4-bit)
 - \circ The number of 32-bit words in the header (15*4=60 bytes)
 - Normally, the value is 5 (no option)
- TOS Type of Service (8-bit)
 - IP Precedence: 3-bit precedence + 4-bit TOS + 1-bit unused
 - O DSCP: 3-bit major class + 3-bit drop preference + 2-bit ECN
- Total length (16-bit)
 - Total length of the IP datagram in bytes

Application	Minimize delay	Maximize throughput	Maximize reliability	Minimize monetary cost	Hex value
Telnet/Rlogin	1	0	0	0	0x10
FTP control	1	0	0	0	0x10
FTP data	0	1	0	0	0x08
any bulk data	0	1	0	0	0x08
TFTP	1	0	0	0	0x10
SMTP command phase	1	0	0	0	0x10

4-bit version	4-bit header length	8-bit type of service (TOS)	16-bit total length (in bytes)			
	16-bit ide	ntification	3-bit flag s	13-bit fragment offset		
	ne to live TL)	8-bit protocol	16-bit header checksum			20 bytes
32-bit source IP address						
32-bit destination IP address						<u> </u>
options (if any)						
data						

DSCP: Differentiated Services Code Point

ECN: Explicit Congestion Notification

Name	Binary Value
Routine	000
Priority	001
Unneduate	010
Flash	011
Flash Override	100
Critic/critical	010
Internetwork Control	110
Network Control	111

Network Layer – IP Header (2)

- DSCP Differentiated Services Code Point (6-bit)
 - Supersede the ToS field in IPv4 to make
 - o per-hop behavior (PHB) decisions
 - Default
 - Best-effort traffic
 - Expedited Forwarding (EF)
 - Dedicated to low-loss, low-latency traffic
 - Class Selector
 - Backward compatibility with the IP Precedence field
 - Assured Forwarding (AF)
 - Give assurance of delivery under prescribed conditions
- ECN: Explicit Congestion Notification (2-bit)
 - FreeBSD 8.0 implement ECN support for TCP
 - Enable ECN via sysctl(8)
 - net.inet.tcp.ecn.enable=1
 - Linux Kernel supports ECN for TCP since version 2.4.20

Binary Value	Description	
00	Non ECN-Capable Transport, Non-ECT	
10	ECN Capable Transport, ECT(0)	
01	ECN Capable Transport, ECT(1)	
11	Congestion Encountered, CE	

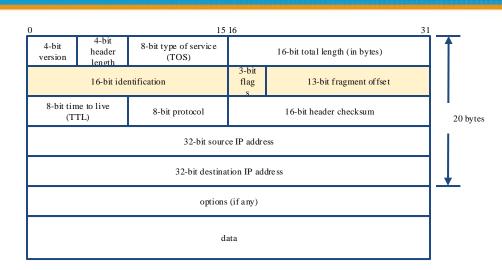

0	10.10					1

Network Layer – IP Header (3)

- Identification (16-bit)
 - Identify the group of fragments of a single IP datagram

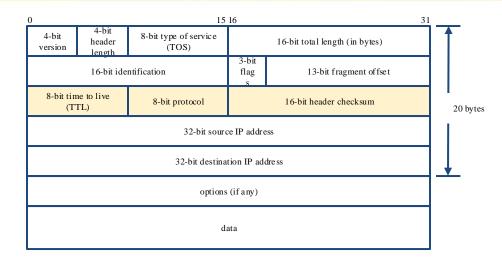

- Fragmentation offset (13-bit)
 - Specify the offset of a particular fragment relative to the beginning of the original unfragmented IP datagram
- Flags (3-bit)
 - All these three fields are used for fragmentation

Reserved	Don't Fragment (DF)	More Fragments (MF)

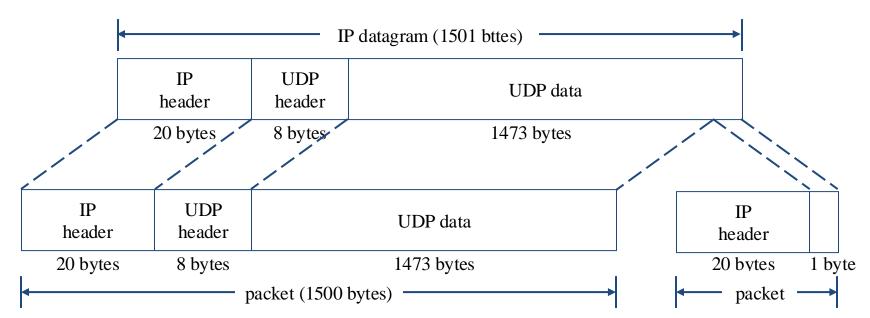

Network Layer – IP Header (4)

- TTL (8-bit)
 - Limit of next hop count of routers
- Protocol (8-bit)
 - Used to demultiplex to other protocols
 - o TCP, UDP, ICMP, IGMP
- Header checksum (16-bit)
 - Calculated over the IP header only
 - If checksum error, IP discards the datagram and no error message is generated

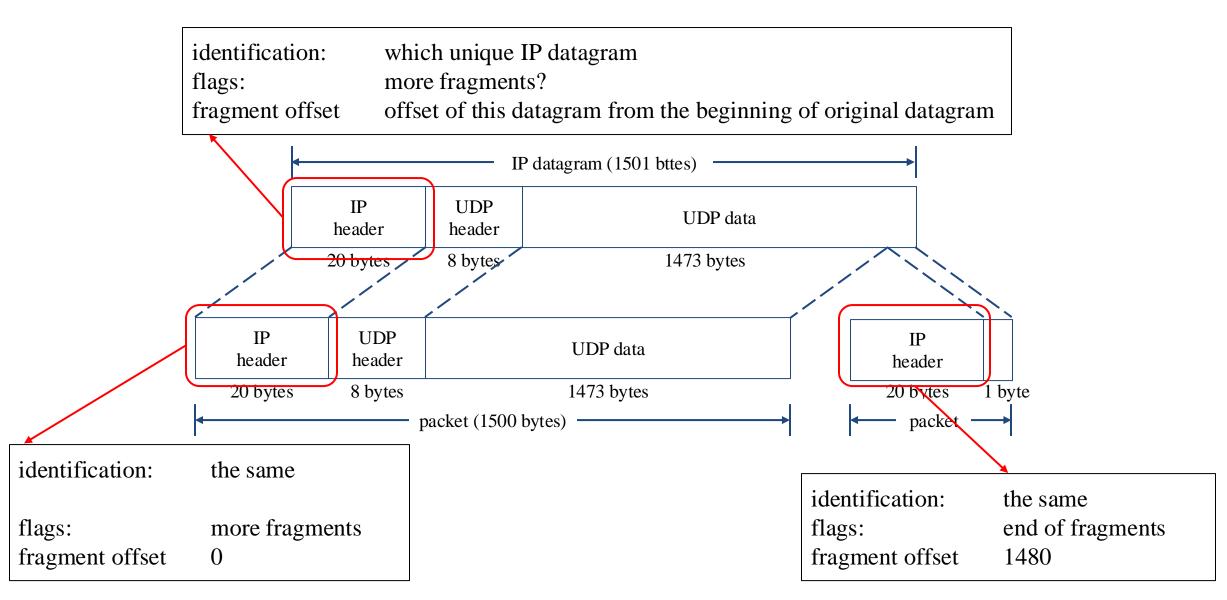

IP Fragmentation (1)

- MTU limitation
 - Before network-layer to link-layer
 - IP will check the size and link-layer MTU
 - Do fragmentation if necessary
 - Fragmentation may be done at sending host or routers
 - Reassembly is done only in receiving host

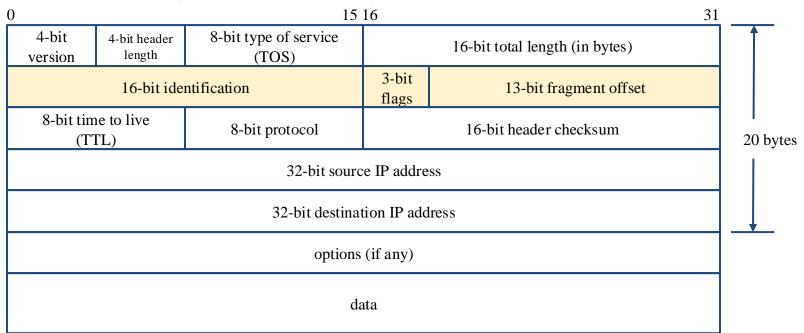

IP Fragmentation (1)

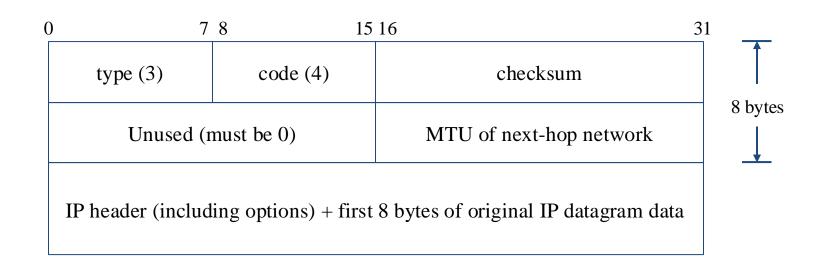

IP Fragmentation (3)

- Issues of fragmentation
 - One fragment lost, entire datagram must be retransmitted
 - If the fragmentation is performed by intermediate router, there is no way for sending host how fragmentation did
 - Fragmentation is often avoided
 - There is a "don't fragment" bit in flags of IP header

ICMP Unreachable Error – Fragmentation Required

- Type=3, code=4
 - Router will generate this error message if the datagram needs to be fragmented, but the "don't fragment" bit is turn on in IP header
- Message format

ICMP – Source Quench Error

- Type=4, code=0
 - May be generated by system when it receives datagram at a rate that is too fast to be processed
 - Host receiving more than it can handle datagram
 - Send ICMP source quench or
 - Throw it away
 - Host receiving UDP source quench message
 - Ignore it or
 - Notify application

Appendix of IP Options: IP Timestamp Option

- IP Timestamp Option
 - Similar to RR option
 - Record Timestamp in option field
 - code, len, ptr are the same as IP RR option
 - OF
 - Overflow field
 - Router will increment OF if it can't add a timestamp because of no room left
 - FL
 - Flags
 - 0: only timestamp
 - 1: both timestamp and IP address
 - 3: the sender initiates the options with up to 4 pairs of IP address and timestamp
